

FUTURE FOOTPRINTS

Material Sense is presenting miraculous new interpretations of products and raw materials. Material Sense focusses on 'circular materialism', and see practical contributions consumers can make to building a sustainable society. Be welcome, meet designers invited by Material Sense, and experience their work. Footprints from the past become visible. Discover their part in the way forward.

Don't miss the thoughtful, inspiring work of masters students from Technical University Eindhoven and Radboud University Nijmegen. They find traces of the past and of usage in future products and materials. Discover inspired new functionalities.

On invitation, artist and performer Hannah Kindler will talk to visitors in her 'R&D Center for Value'. What are your ideas about value and how can we create new value for products in the future?

Material Sense LAB is initiated by Material Sense to encourage materials research into viable products. Raw materials are bio-based materials or revalued resources.

We want to contribute to a circular economy by new forms of co-operation. Working on this are new talents, researchers, designers, artists and manufacturers. The ambition is to find new markets where materials can blossom in a sustainable way. Material Sense aims to continue acting as a catalyst and connector, as independent organisation for materials innovation. We focus on the materiality of products, through design and development, research and experimentation. Material Sense makes the world of materials visible and tangible through projects, exhibitions, lectures and publications.
